

## ABSTRACT

A context-aware imaging device is described. The device includes an image capturing and display system having an image capturing system that captures an image containing a landmark of interest, and an image display that displays the captured image. A context interpretation engine is provided to generate contextual information relating to the landmark. A context rendering module is coupled to the context interpretation engine to render the contextual information to the user of the imaging device. All modules of the context-aware imaging device form a physically integrated unit.
